

## Super Simple DSP Scrap Cards By The Batch

Make these easy cards in batches of 12 at a time. No two alike - Over 2000 possibilities,

Choose Three pieces of 12x12 Designer Paper from the same set that work well together. Cut yourself one tall strip at 4" wide from all three.

Then cut those strips all in half at 6" and in half again at 3" - so you end up with twelve pieces that measure 4" x 3".

Put all your squares of paper in a pile and pick ANY three different patterns and stack them together in a sandwich. Repeat and make 3 or more sandwiches and set these aside.

Don't forget that your DSP has a second side too - so do the next sandwich with the backsides, and the next with some of the front and some of the back. You actually have 1320 different possible combinations of three strips of DSP for your card fronts from one pack of paper. *For you math people - there are 12 different prints in a pack - by choosing the first strip pattern, you now have 11 possibilities for the second strip, and then 10 for the third. That equates to  $12 \times 11 \times 10 = 1320$  combos.*

Cut two strips off of your sandwich measuring 1-5/16" The remaining piece will be hair larger in width at 1-3/8" - Keep your three piles organized. I suggest you do these one sandwich stack of three at a time like this to keep them straight.

You should have nine strips of paper now. Take the three strips from the first pile and lay them out as the LEFT piece in three card layouts.

Then take the second pile and lay those pieces out next as the RIGHT ones, but stagger them starting with the second layout, then third then go back to the first, so you have different papers in each of your layouts.

Then stagger the third pile - the slightly wider ones - so you have three different papers in each layout.

Now go back and do the same with your other paper sandwiches.

Once you have your twelve little strip piles sorted out, cut yourself twelve matte pieces at 4-1/2" x 3-1/4" of either Whisper White or Very Vanilla according to the base colour in your DSP

Glue your strips onto the mattes starting with the two outside ones first, followed by the middle one, so that you leave a 1/8" margin on all edges and in between pieces. Leaving the middle one to last will allow for a little fudging in aligning the strips. Use liquid glue!

Choose six sheets of coloured cardstock for your card bases and divide and score them. Then using dimensionals on the backs of the mattes, adhere them to the card bases. Make yourself twelve sentiment strips, tags or die-cuts—stamp and adhere those to the front with more dimensionals.

Voila - twelve completely different and beautiful cards in under an hour. From the remainder of your three sheets of DSP you can do this twice more for thirty six additional cards. From a single pack of DSP you can get 144 uniquely different cards.
